Noise in the Evolution of Communication and Thought:
How Natural Selection and Noise Shape Animal and Human Minds

R. Haven Wiley, Hickory Woods Press, 2023

Detailed Table of Contents

Preface

Section I: Introduction

Chapter 1: Evolution of Communication
Introduction
Comparative Study of Communication
Evolution of Honesty
Evolution of Cooperation
Evolution of Individual Recognition
Evolution of Mating Preferences by Sexual Selection
Evolution of Communication in Noise
General Principles for the Evolution of Communication
References

Chapter 2: Features of Human Language
Introduction
Cultural Transmission
Semanticity, Displacement, Arbitrariness, and Discreteness
Prevarication
Duality of Patterning and Openness
Hierarchical Organization
Language as Criteria for Responses
From Nonhuman to Human Language
Conclusion
References

Chapter 3: Evolution of Self-Awareness
Introduction
Continuity between Human and Nonhuman Animals
Neurophysiology of Consciousness
Continuity between Brains and Other Machines
Noise as a Determinant of Consciousness
Conclusion
References

Chapter 4: Evolution of Free-Decision
Introduction
Unpredictability and Decisions in Noise
References

Chapter 5: Evolution of Noisy Communication
Introduction
Twelve Predictions
(1) Noise creates an unavoidable trade-off between two kinds of error for receivers
(2) A receiver's optimal criterion for response depends on the level of signals
(3) A signaler's optimal level of signaling depends on the receiver's criterion
(4) Communication in noise can evolve to a joint optimum
(5) Communication at a joint optimum is honest on average
(6) A joint optimum for communication in noise does not eliminate noise
(7) Many parameters of communication in noise remain poorly studied
(8) Noise leads to strong predictions for the evolution of exaggeration and thresholds
(9) Signals for advertising and for warning are contrasts in probable costs of error
(10) Evolution of new signals and responses encounters a hurdle
(11) New signals and responses can evolve by exploitation
(12) Joint evolution of signalers and receivers has a predictable direction
Conclusion
Appendices
(1) Optimal levels of exaggeration for advertisement
(2) Optimal levels of exaggeration for solicitation
References

Chapter 6: Evolution by Natural Selection
Introduction
Basic Issues
Heritable Differences
Variation in Heritable Features
Cooperation and Competition
Constraints on Natural Selection
Evolutionary Computation
Conclusion
References

Section II: Difficult Issues in Communication: Introduction

Chapter 7: A Receiver-Signaler Equilibrium

Introduction
Preview of the Argument
The Equations for Sender and Receiver
1. The signal detection paradigm
2. The receiver's optimal performance
3. The signaler's optimal exaggeration
4. The receiver's and signaler's joint optimum
5. Communication during mate choice and warning calls
Solutions for optimal thresholds and exaggeration
1. Mate choice: the receiver's utility
2. Mate choice: the signaler's utility
3. Mate choice: the optima for receiver and signaler
Mate choice: influences of the receiver and signaler at the joint optimum
1. Receiver's payoffs
2. Signaler's benefit and cost
3. Comparison of mate choice and warning signals
Evaluation of the Results
1. Introduction
2. Costs and benefits of signals and the stability of honesty
3. De novo evolution of signals
4. Exaggeration of signals
5. No perfection in communication: Noise is inescapable
Figures
References

Chapter 8: Signal detection and Communication

Introduction
Essential Features of Signal Detection
Signal Detection in Experimental Psychophysics
General Assumptions of Signal Detection Theory
Specific Assumptions of Signal Detection Theory: Measuring Signal Detectability
1. Normal distributions with equal variance
2. Optimal criteria
3. Cuing of Responses
Properties of Signals that Affect a Receiver's Performance
1. Contrast
2. Redundancy
3. Uncertainty and unfamiliarity
Classification of Signals in Addition to Detection
Complex Patterns: Extension of the Concept of Channels

[Chapter 8 continued]
Evolution of Signaling and Responses
Interpretation of Playback Experiments with Signal Detection Theory
Practicalities of Experiments in Natural Situations
Summary
Figures
References

Chapter 9: Communication as Transfer of Information
Introduction
Communication as a Transfer of Information
Manipulation versus Information
Communication as Categorization and Association
Communication of States of Mind
References

Summary and Final Thoughts
Noise in the Development of Individual Organisms
Noise in Human Communication
The Biology of Philosophy
Hope and Humility

Acknowledgments
